Cambridge International Advanced Level

CANDIDATE NAME			
CENTRE NUMBER		CANDIDATE NUMBER	
MATHEMATICS			9709/51
Paper 5 Mechanics 2	(M2)	Octo	ber/November 2017
			1 hour 15 minutes
Candidates answer or	n the Question Paper.		
Additional Materials:	List of Formulae (MF9)		

#### **READ THESE INSTRUCTIONS FIRST**

Write your Centre number, candidate number and name in the spaces at the top of this page.

Write in dark blue or black pen.

You may use an HB pencil for any diagrams or graphs.

Do not use staples, paper clips, glue or correction fluid.

DO NOT WRITE IN ANY BARCODES.

### Answer all the questions.

Give non-exact numerical answers correct to 3 significant figures, or 1 decimal place in the case of angles in degrees, unless a different level of accuracy is specified in the question.

Where a numerical value for the acceleration due to gravity is needed, use  $10 \text{ m s}^{-2}$ .

The use of an electronic calculator is expected, where appropriate.

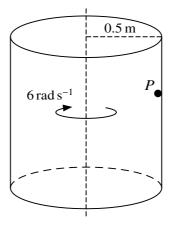

You are reminded of the need for clear presentation in your answers.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [] at the end of each question or part question.

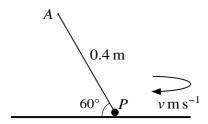

The total number of marks for this paper is 50.

A hollow cylinder with a rough inner surface has radius  $0.5\,\mathrm{m}$ . A particle P of mass  $0.4\,\mathrm{kg}$  is in contact with the inner surface of the cylinder. The particle and cylinder rotate together with angular speed 6 rad s<sup>-1</sup> about the vertical axis of the cylinder, so that the particle moves in a horizontal circle (see diagram). Given that P is about to slip downwards, find the coefficient of friction between P and the surface of the cylinder. [4]

of the ball.

One end of a light inextensible string of length 0.4 m is attached to a fixed point A which is above a smooth horizontal surface. A particle P of mass 0.6 kg is attached to the other end of the string. P moves in a circle on the surface with constant speed  $v \, \text{m s}^{-1}$ , with the string taut and making an angle of  $60^{\circ}$  with the horizontal (see diagram).

Given that $v = 0.5$ , calculate the magnitude of the force that the surface exerts on $P$ .	[4]

- A particle P is projected with speed  $25 \,\mathrm{m\,s^{-1}}$  at an angle of  $30^\circ$  above the horizontal from a point O on horizontal ground. At time t s after projection the horizontal and vertically upwards displacements of P from O are x m and y m respectively.
  - (i) Express x and y in terms of t and hence show that the equation of the trajectory of P is

$y = \frac{x}{\sqrt{3}} - \frac{4x^2}{375}.$	[4]
